## Customer Reviews

Grade 3-6-This book's spectacular full-color photographs will capture readers' attention and the text and well-designed diagrams will hold it. The endpapers profile the world's major peaks, allowing for a visual comparison of heights. More information about the major ranges is provided as the different types of mountain formations are considered. Simon also covers their shaping by the forces of erosion, their effect on weather and climate, and their impact on vegetation and animals, including humans. Like the author's other "Earth Science" books, this one will be used by both report writers and browsers. Gr. 2-4. A fine companion to Simon's books on oceans, volcanoes, and deserts, this features

spectacular photographs, including a few extraordinary double-page spreads that make faraway mountain ranges look like they're right in your own backyard. The accompanying text, nicely spaced and in slightly oversize, dark, clear type, concentrates predominantly on different types of mountains--folded, fault-block, volcanic, dome--and how they're formed, with a word or two about erosion and a mountain's effect on climate. There's nothing stuffy about Simon's word descriptions, which are accompanied by maps and cutaway drawings to make concepts even clearer.

(Unfortunately, the map and text don't agree in one instance.) The attractive endpapers are a bonus; the world's tallest peaks, in colored sketches, are juxtaposed to show how heights compare. Stephanie Zvirin --This text refers to an out of print or unavailable edition of this title.

These are very informational and perfect for kids. My 9 year old absolutely loves them! Some of the medical books (heart, bones, brain) are a bit out of reach for my 4 year old and 6 year old, but they still listen and love looking at the pictures. Great, great, great books!

Perfect!

Seymour Simon has a lot of very nice little books for children. This is one about Mountains. The photos are stunning, well-chosen, and the lessons can be digested by early childhood children. It prepares them for 8th grade science, earth science/geology, and helps built in them appreciation for the earth, its formation, giving them insight into volcanoes as well, something most children are fascinated with. It is a book that children can read or just thumb through he pictures with.

Recommended supplementary science book. Most of Seymour Simon's books are very good, as is this one.

Great book, containing quality photos. If you have interest in photography and nature scenes ( mountains ) buy this book. The hardcover have a lot of quality , a must buy !

This book is very very good, striking photos of mountains, very good quality paper and some dazzling scenes. If you have interest in photography and in nature scenes ( mountains ) buy this book !
